ABSTRACT

In recent years there has been an extensive research on drug development in the various aspects of the diseases like jaundice, hypercholesterolemia and hyperthyroidism. Cholestyramine is a synthetic resin in nature which has been used widely for treatment of same, it is a quaternary ammonium anion exchange resin with a strong affinity for bile salts and tablet dosage form will play a key role in its release and action. Studies also show that this resin is showing anti hyperthyroidism action, therefore based on these results this paper gives a brief application of a tablet dosage form in the treatment of the hyperthyroidism.

KEYWORDS

Hyperthyroidism, Cholestyramine and Formulation.

INTRODUCTON

Cholestyramine is a resin in nature; it forms an insoluble complex with thyroxin. the Cholestyramine is water insoluble and when it is administered orally it will enter in the gastrointestinal system but it would not absorb at any part of GIT as a result it gets entered into the intestine without any structural or chemical changes in it. As it reaches to intestine excess thyroid hormone which would be present in the intestine will bind with the cholestyramine and it will get excreted through feces¹. T₄ uptake takes place in the duodenum, ileum. jejunum and and is approximately 70-80%.

Cholestyramine shows good anti hyperthyroidism activity according to studies. Bile-salt sequestrants have ability to bind thyroid hormone; it binds with thyroid in the intestine and it leads to increase in its fecal excretion. According to these observations, the cholestyramine has been taken for study for its use against hyperthyroidism. When it comes to an issue hyperthyroidism; of treating cholestyramine sequester T₄ i.e. thyroxin in the intestine and increases its fecal excretion. Cholestyramine enhances the thyroid excretion; according to studies 50mg of cholestyramine binds 3000 μ g of T₄². Existing treatment therapy for hyperthyroidism uses drugs like methimazole, propylthiouracil etc. Cholestyramine could become a new option in the treatment of hyperthyroidism. As a nature of cholestyramine is a resin it has higher binding capacity so that it will specifically bind thyroxin in the intestine which leads to decrease T₄ level in blood³.

As tablet is a widely accepted and has high patient compliance, it gives a various facets for the development of any drug into a tablet dosage form. Tablet is a unit solid dosage form easy to administer and is widely accepted by patients. Uncoated tablets have faster disintegration and it can be released in intestine, as a result more precise and desired action can be seen. Cholestyramine irreversibly binds to the bile salts with no effect of temperature. Conjugated bile salts completely dissociated and it is readily available for binding to resin at intestinal pH, with electrostatic binding mechanism.

MATERIAL AND METHODS Procedure

- 1. Tablets were punched by direct compression method.
- 2. All the ingredients including Cholestyramine were weighed for 20 tablets.
- 3. The selected binder taken according to batch F1 to F5 was HPMC, Crosspovidone, Methyl Cellulose and Ethyl Cellulose.
- 4. Drug combined with the binder and mixed well.
- 5. Sodium Starch Glycolate and Purified talc were added and mixed again.

Available online: www.uptodateresearchpublication.com

- 6. Shape of punch was round shaped with size 12mm
- 7. Powder mixture which had prepared introduced in the tablet punching machine and tablets were punched.

Equipment

• Cadmac 16 station Tablet Punching Machine.

Evaluation Tests

Post compressional studies

Weight Variation

Weight variation test is an unofficial test of tablet evaluation for the weight variation test 20 tablets were taken and weighed each tablet. Weight of each tablet was recorded. Sum of all tablet weights had been performed and its average calculated, by applying limit of 5% \pm to average weight.

Hardness

Hardness test has been carried out by the Monsanto hardness tester.

Friability

20 tablets were introduced in the tablet friability apparatus, before its introduction in the machine collective weight of 20 tablets were done and after 100 rotations all tablets were taken of and its collective weight had calculated which had not shown more than 1% loss.

Disintegration

6 tablets of each batch were taken and average of all was calculated.

RESULTS AND DISCUSSION

Amongst the entire batches batch F2 was found to be optimized batch with passing weight variation test, Hardness 3.5, Friability 0.3% loss and 4.40min disintegration time. Cholestyramine can be used as a tablet dosage form by using polymers like HPMC, Crosspovidone, Methyl Cellulose and Ethyl Cellulose. This will improve patient compliance and it will give a new option for treatment of hyperthyroidism.

| S.No | Ingredients | F1 | F2 | F3 | F4 |
|------|-------------------------|-----------|-------|-----------|-----------|
| 1 | Cholestyramine | 500mg | 500mg | 500mg | 500mg |
| 2 | HPMC | 3% | - | - | - |
| 3 | Crosspovidone | - | 3% | - | - |

CONCLUSION

Batch F 2 has shown the desired effects for the need of treating hyperthyroidism.

ACKNOWLEDGEMENT

Authors are thankful to Phaex Polymers Pvt.Ltd. Murbad MIDC, Dist. Thane, Maharashtra for providing cholestyramine sample for studies.

CONFLICT OF INTEREST

We declare that we have no conflict of interest.
